

**APPENDIX B - BLOCKED/PHASED MAINTENANCE PROGRAM****A. SCOPE**

This Appendix provides useful information related to maintenance program packaging. The maintenance requirements for this model are not grouped into letter checks but can be grouped into one of two types of Base Maintenance Checks - (1) C checks or (2) Heavy Maintenance Visit (HMV).

- The C check is comprised of MPD Tasks that are in-depth inspections known as systems checks or zonal checks.
- The HMV check is comprised of MPD Tasks that include the underlying C check plus structural checks. Accomplishment of the HMV check entails removal of monuments, floor panels/sidewalls/bins, and fuel tank entry.

Each task has a specific interval which will fall into a specific Base Maintenance Check as determined by airplane utilization, access, and inspection type (i.e., system or structural). This Appendix provides labor hour information for each MPD task along with the associated threshold and repeat interval, which is given in terms of Flight Hours (FH), Flight Cycles (FC), or calendar time (either HR, DY, MO, or YR).

**B. MAINTENANCE PROGRAM****1. SCOPE**

This Appendix to the MPD provides a sample blocked/phased program containing all of the scheduled maintenance tasks in the MPD. The sample program contained herein should be used as a basis for establishing a blocked/phased maintenance program.

This blocked/phased program fully complies with all MPD task intervals for the average fleet utilization (1.8 FH per cycle and 9.5 HR per day). This blocked/phased program concept is similar to the scheduled maintenance programs for other Boeing models that are defined by multiple 'A' and 'C' check packages and a heavy maintenance visit (sometimes referred to as HMV or 'D' check). This sample blocked/phased program may also provide a basis for lessors/lessees to define maintenance requirements associated with the heavy maintenance visit and to determine the tasks associated with a particular base maintenance visit or HMV check package. This sample maintenance program package could be used as guidance for defining content of qualifying maintenance event related to airplane lessor/lessee maintenance reserves.

**2. BASIC PROGRAM RULES**

The blocked/phased program was developed with the following assumptions:

- An airplane average utilization of 9.5 FH/day and 1.8 FH/cycle
- The sample program contained in this appendix groups tasks into Phases which can then be further described as A Checks, C Checks, or HMV Checks. Some tasks are de-escalated, as needed, for packaging into a particular Phase for the convenience of packaging, cost savings, ready access to the area, and other considerations. Although there are no technical concerns for the early accomplishment of tasks, financial cost of ownership considerations should be coordinated between lessor and lessee.
- The early performance of tasks prior to the threshold interval would be considered the completion of the threshold interval and the repeat interval would then be applicable to that task going forward.
- Other lower repetitive tasks should be included in Base/HMV as indicated in the Skyline Charts in Figures B-2, B-4, and B-6.

- This appendix is for reference use only. The work content of the sample program must be evaluated against tasks added, deleted or revised in the MPD since the issuance of this Appendix.

### **3. PROGRAM DEFINITION**

The sample blocked/phased program includes:

- Manhours Summary by Phase Group and Skill
- Maintenance Task Operating Plan (MTOP) sorted by task number.

The MTOP is a report (in matrix format) showing each task and what phase group the task is associated with and is dependent on the basic program utilization parameters and equivalent A checks, C checks, or HMV checks as defined in the applicable Report Parameters Header Page – “Customized Maintenance Program Packaging Index.”

Manhour Summary by Phase Group, Skill and Access:

- This summary presents the summed hours for each airplane visit given the basic program utilization parameters and equivalent "A" (120 days) and Base check (36 months) intervals based on the table, “Manhour Summary by Skill for Each Phase Group”. The Skyline chart shows the airplane visit (phase group) and the associated maintenance manhour extracted from the MPD for a duration of 25 years. Note that the MPD manhours do not include setup, rectification, docking time, etc. and they may vary between operators given facilities, experience, labor rules, etc. The manhour summary by skill allocates the total phase group hours by skill. Appearance related tasks (seat, galley, cabin refurbishment), are not included in the MPD.

Maintenance Task Operating Plan (MTOP):

- The MTOP is a report (in matrix format) showing each task and what phase group the task is associated with and is dependent on the basic program utilization parameters and equivalent A Checks, C Checks, or HMV as defined in the applicable Report Parameters Header Page - “Customized Maintenance Program Packaging Index.”
- Suggested packaging are as follows:
  - 8-10-12 for line numbers 1 to 5645, where check packages can be conveniently scheduled at 'A' check at 120 days and base maintenance 'C' check at 7500 FH/24 Months.
  - 8-14-20 for line numbers 1 to 5645 that have not gone through the initial 8 year HMV, where check packages can be conveniently scheduled at 'A' check at 120 days and base maintenance 'C' check at 7500 FH/24 Months.
  - 9-15-21 for line numbers 5646 and subsequent, where check packages can be conveniently scheduled at 'A' check at 120 days and base maintenance 'C' check at 12000 FH/36 Months.

### **4. BRIDGING MAINTENANCE PROGRAM**

Bridging of maintenance programs allows an operator to account for all scheduled maintenance requirements for transition from one maintenance program to another. Building a bridging maintenance program depends upon certain information such as the airplanes past and future utilization (FH/day and FH/cycle), whether the current program is a blocked/phased program or phased program, and the content of the old and new programs. An operator should consider the following items while building a bridging maintenance program.

## 737-600/700/800/900/900ER MAINTENANCE PLANNING DOCUMENT

- A. Where is the airplane in terms of the maintenance cycle? Express this in terms of the tasks that have been accomplished, and what the airplane flight hours, cycles and date was at the time each task was accomplished. The tasks still to be accomplished also need to be identified with the amount of flight hours/cycles/time remaining until each task is due.
- B. Define and understand the next scheduled maintenance program based upon a given utilization and the availability of the airplane for maintenance visits or define the adjusted blocked program using the rules in section 2 of this appendix. Packaging the next scheduled maintenance tasks may involve the accomplishment of tasks sooner than when they are due. This is to line up repeat inspections that involves extensive and heavy access.
- C. Identify any tasks in the existing or new scheduled maintenance program that are unique to the airline's operation (i.e. not in the MPD) and are not mandatory in one program but mandated in the other program. Note the reason the unique task is required (i.e. delay, accident report, unscheduled removal, service experience, other comments, etc.)
- D. To simplify bridging, the operator shall retain all MPD task numbers or provide a cross-reference correlation between the operator's numbering system and the MPD task number should be created. This includes any revisions to the MPD published over time.
- E. The airplane is maintained under the new maintenance program once the bridging package is completed.
- F. The early performance of tasks prior to the threshold interval will be considered the completion of the threshold interval and therefore tasks would now fall due based on the repeat interval.

### 5. MAINTENANCE PROGRAM START TIME

Unless it is specified by Boeing in the delivery documentation of the aircraft, the point at which the Scheduled Maintenance Tasks due dates for first accomplishment of Calendar driven Tasks is the date of the issuance of the Certificate of Airworthiness (C of A).

- A. The start date for an overhauled landing gear is the date of installation on the aircraft. If the landing gear is preserved with an approved preservation program, the landing gear calendar time may start at first flight.
- B. For time controlled item/equipment with intervals as defined or recommended by the vendor/equipment manufacturer or by a National Requirements are the date of manufacture unless otherwise stated by the vendor or national authority.
- C. Airworthiness Directive (AD) items as stated by the AD.
- D. Accomplishment of maintenance / modification at the release from maintenance.
